

Presentation of the sternal Ceramil[®] implant in 3 different international congresses

I.Ceram, specialized in biocompatible ceramic implants loaded in active molecules for local skeletal delivery, participates in 3 international medical congresses focusing on cardiac and thoracic surgery with the purpose of presenting the ceramic sternum and its properties to cardiac and thoracic surgeons.

These congresses are the main meetings for cardio-thoracic surgeons but also for international distributors specialized in cardiac surgery who are in search of the latest innovations in terms of implants or surgical techniques.

The first congress dedicated to pediatric cardiac surgery, the *Annual Meeting of the Association for European Pediatric and Congenital Cardiology*, took place in Athens (Greece), May 9 to 12 and allowed I.Ceram teams to present at their booth the Ceramil[®] sternal implant and its use case in a girl born with a sternum agenesis.

Surgeons attending this congress discovered the product and its main characteristics such as biocompatibility and bone integration but also the surgical technique and the main indications in which it has already been used: tumor, infection, agenesis.

During this congress, I.Ceram received a lot of expression of interest from surgeons and European distributors.

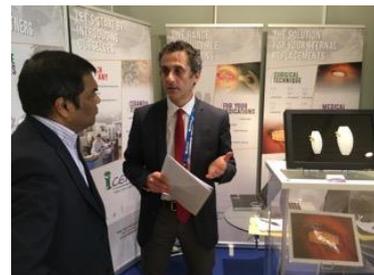

I.Ceram Teams will continue presenting the implant during the *26th European Society of Thoracic Surgeons Meeting* which will take place in Ljubljana (Slovenia) from May 27 to 30 and during the *71st congress of the French Society of Cardiac and Thoracic Surgery (SFCTCV)* in Lille (France) from June 13 to 15.

This showcasing of the ceramic sternal implant to specialized surgeons should allow I.Ceram to achieve deals with international distributors and confirms its willingness to market its sternum as soon as the CE marking is obtained.
